The timeline provides a historic view of the project in a single report.

It lists all Trac events that have occurred in chronological order, a brief description of each event and if applicable, the person responsible for the change.

The timeline lists these kinds of events:

- **Wiki page events** -- Creation and changes
- **Ticket events** -- Creation and resolution/closing (and optionally other changes)
- **Source code changes** -- Repository check-ins
- **Milestone** -- Milestone completed

Each event entry provides a hyperlink to the specific event in question, as well as a brief excerpt of the actual comment or text, if available.

See [TracIni](#) for timeline configuration options.

RSS Support

The Timeline module supports subscription using RSS 2.0 syndication. To subscribe to project events, click orange **XML** icon at the bottom of the page. See [TracRss](#) for more information on RSS support in Trac.
